PART A

For each of the following questions there are four choices marked A, B, C and D. Only one of them is correct. You should decide on the correct choice and write down its mark in ().

ANSWER: 1. C 2. B 3. C 4. C 5. C 6. D

PART B

Answer the following questions.

1. ANSWER:

Data independence refers to the immunity of application programs to changes of the data structure. There are two types of data independence in a database environment: logical data independence and physical data independence.

Logical data independence refers to the immunity of external schemas to changes in conceptual schema. Physical data independence refers to the immunity of conceptual schemas to changes in internal schema.

Data independence has important significance, since the changes in the lower level of the database system do not incur the change in the higher level of the database system. This makes the database environment easier to be managed and used than file-based systems.

2. ANSWER:

A relation is a uniquely named two-dimensional table with identically structured rows (technically tuples) and distinctly named columns (or attributes).

Relational Integrity: includes entity integrity, referential integrity and user defined integrity.
